Transportation Assignment 6

R Markdown

This is an R Markdown document. Markdown is a simple formatting syntax for authoring HTML, PDF, and MS Word documents. For more details on using R Markdown see http://rmarkdown.rstudio.com.

When you click the **Knit** button a document will be generated that includes both content as well as the output of any embedded R code chunks within the document. You can embed an R code chunk like this:

Note that the echo = FALSE parameter was added to the code chunk to prevent printing of the R code that generated the plot.

Model name: a linear program with 6 decision variables and 5 constraints

```
/* Objective function */ min: 22X600 x11 + 14X600 x12 + 30X600 x13 + 16X625 x21 + 20X625 x22 + 24X625 x23
/* Constraints */
x11 + x12 + x13 <=100 x21 + x22 + x23 <=120 x11 + x21 =80 x12 + x21 =60 x13 + x23 =70
Now, load the library
library(lpSolveAPI)
```

Let us set up the Heart Start transportation problem. We have 6 decision variables, and 5 constraints. In the first formulation, we will directly create the objective function and constraints.

```
# make an lp object with O constraints and 6 decision variables
lprec <- make.lp(0, 6)</pre>
# Creating objective function. The default is a minimization problem.
set.objfn(lprec, c(13200,8400,18000,10000,12500,15000))
# As the default is a minimization problem, so no need to change the direction
# Add the constraints
#Plant production Capacity constraints
add.constraint(lprec, c(1, 1, 1, 0, 0, 0), "<=", 100)
add.constraint(lprec, c(0, 0, 0, 1, 1, 1), "<=", 120)
#Warehouse demand constraints
add.constraint(lprec, c(1, 0, 0, 1, 0, 0), "=", 80)
add.constraint(lprec, c(0, 1, 0, 0, 1, 0), "=", 60)
add.constraint(lprec, c(0, 0, 1, 0, 0, 1), "=", 70)
# Set bounds for variables explicitly.
set.bounds(lprec, lower = c(0, 0, 0, 0, 0, 0), columns = c(1, 2, 3, 4, 5, 6))
# set variable names and name the constraints
```

```
RowNames <- c("PlantAProdCap", "PlantBProdCap", "Ware1Demand", "Ware2Demand", "Ware3Demand")
ColNames <- c("PlantAWar1Quant", "PlantAWar2Quant", "PlantAWar3Quant", "PlantBWar1Quant", "PlantBWar1Quant",
dimnames(lprec) <- list(RowNames, ColNames)</pre>
# Now, print out the model
lprec

## Lower
                                                                                                                              0
                                                                                                                                                                         0
                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                 0
# The model can also be saved to a file
write.lp(lprec, filename = "HeartStart.lp", type = "lp")
We now solve the above LP problem
solve(lprec)
## [1] 0
We now output the value of the objective function, and the variables
get.objective(lprec)
## [1] 2444000
get.variables(lprec)
## [1] 0 60 30 80 0 40
x <- read.lp("HeartStart.lp") # create an lp object x
                                                                                # display x
